Loading Chute S300T/6

Type of project:	Loading of grain
Scope of supply:	1 unit
Capacity:	Max 150m ³ /h
Client:	Firma Liucija / Kedainiu grudai
Year:	2004

Detail Information

The loading chute is used for loading grain into tanker trucks.

To ensure the possibility of filling the tanker trucks to max. allowance weight the loading chute is equipped with a combined disperser and closing cone unit. Because of the high demands from authorities regarding the handling of products for human nutrition the loading chute needs to be equipped with a closing cone in order to avoid insects and birds to enter the chute when not in use, and to avoid any spillage when the chute is retracted after the loading has ended

The loading chute is also equipped with a level sensor based on the load of the disperser motor – when the tanker truck is filled up to the hatch the load will increase on the motor and a sensor relay switches of the loading process.

The modular construction ensures easy and quick replacement of single modules in case of damage to the bellow section. The external connection rings are in stainless steel with sturdy wire guides in nylon.
